

MediCare Mobile App

UI/UX Design Brief — From-Scratch Build

App Overview

- Product: MediCare — a clinical workflow app for healthcare staff.
- User roles: Physician, Therapist, Nurse, Receptionist, Billing Officer, Admin.
- Navigation should be role-based: each user only sees the tabs/features relevant to their role (e.g. a Billing Officer sees Billing but not Consultations).
- Platform: React Native, targeting iOS and Android.
- Companion product: a web app used by the same staff for a broader set of features (see Section K for features expected to remain web-only in an early phase).

How to Use This List

- “Priority” marks a screen as MVP (needed for a usable v1) or Phase 2 (can follow later). This split is a suggested starting point — confirm it with the product team before treating it as final scope.
- “Key elements to design” is a starting list of components and states — not exhaustive. Flag anything missing as you design each screen.
- Section I lists UI states (empty, loading, error, etc.) that repeat across almost every screen — design these once as reusable patterns rather than per-screen.

Section A — Auth & Account Recovery

Screen	Priority	Purpose	Key elements to design
Login	MVP	Email/password sign-in for clinical staff.	Form layout, inline validation errors, loading state.
Forgot Password	MVP	Self-service password reset request.	Email input, confirmation screen (“check your email”), error state (unknown email handled generically for security).
Reset Password	MVP	Set a new password from a reset link/code.	New password + confirm fields, strength indicator, success state.
MFA Verification	MVP	TOTP/backup-code entry after login.	Code input, resend / use-backup-code fallback, error state.

Section B — Core Navigation / Dashboard

Screen	Priority	Purpose	Key elements to design
Home / Dashboard	MVP	Landing screen after login: today's schedule and quick stats, tailored to the signed-in role.	Stat cards, today's schedule list, empty-day state, role-based content variation.
Notifications / Alerts Center	MVP	Central inbox for system and clinical alerts (new lab result, appointment change, etc.).	List with read/unread state, notification type icons, empty state, tap-through to source record.

Section C — Patient Management

Screen	Priority	Purpose	Key elements to design
Patient List	MVP	Search and browse all patients.	Search bar, list item (avatar, name, status badge), add-patient action, empty/no-results state.
Patient Detail	MVP	Full patient profile across tabs: Overview, Health Records, Encounters, Prescriptions, Medical Files.	Header (demographics, alerts), tab bar, vitals summary, care journey stepper, per-tab content layout.
Registration Method Selector	MVP	Entry point to register a new patient.	Option cards: Manual, Live Intake (voice), Document OCR — icon + short description each.
Manual Registration	MVP	Hand-entry patient registration form.	Multi-field form, sectioning (demographics, contact,

Screen	Priority	Purpose	Key elements to design
			insurance), validation, save/cancel.
Live Intake Registration	MVP	Voice-driven intake with AI transcription into form fields.	Recording indicator, live transcript view, field auto-fill confirmation, edit-before-save.
Document OCR Registration	MVP	Scan an ID or paper form; AI extracts patient details.	Camera/upload trigger, scan preview, extracted-field review/edit screen.

Section D — Appointments

Screen	Priority	Purpose	Key elements to design
Appointments List	MVP	Full appointment list with status filters.	Filter chips (all/scheduled/confirmed/completed/cancelled), list item with status color, confirm/start-consultation actions.
Create / Edit Appointment	MVP	Schedule or modify an appointment.	Patient picker, date/time picker, provider/type fields, save state.

Section E — Consultations

This is the core clinical workflow of the app and includes voice-driven note-taking. Give the Live Consultation screen extra design attention.

Screen	Priority	Purpose	Key elements to design
Consultations List	MVP	Doctor-facing consultation history.	List with resume/view actions, “new consultation” modal (type + chief complaint).
Live Consultation	MVP	Active consultation workspace — the most complex screen in the app.	SOAP tabs (Free Notes/Subjective/Objective/Assessment/Plan/Handout), voice scribe recording UI, vitals input (BP/HR/Temp/O2), AI handout generation.
Consultation Review	MVP	Post-visit screen to finalize the encounter.	Summary layout, create prescriptions from notes, template picker, export/print/share actions.
Consultation History	MVP	Read-only view of a completed consultation's SOAP notes.	Clean read-only layout matching the live-consultation tab structure.

Section F — Prescriptions

Screen	Priority	Purpose	Key elements to design
Prescriptions List	MVP	Prescription list for the clinician/pharmacist.	List item, create-Rx action, inline safety-warning state.
Create Prescription	MVP	Prescribe medication.	Drug name, dosage, frequency, duration, instructions fields; drug-safety warning pattern.
Prescription Detail	MVP	View a single prescription.	Detail layout (medications, dosage, frequency, duration, validity period, refill count), refill/print actions.

Section G — Billing

Screen	Priority	Purpose	Key elements to design
Billing / Invoices List	MVP	Invoice list with payment status.	List item with status badge, filter by paid/unpaid, totals summary.
Invoice Detail	MVP	View a single invoice.	Line items, amount due, payment status, payment history if applicable.

Section H — Account, Settings & Support

Screen	Priority	Purpose	Key elements to design
User Profile	MVP	View/edit the signed-in user's own details.	Avatar, name, role (read-only), contact info, change-password link.
App Settings	MVP	App-level preferences.	Notification toggles, language (if applicable), logout, app version info.

Section I — Shared UI States

These states recur across nearly every list and detail screen above. Design them once as reusable patterns rather than redesigning per screen:

- Empty state (no data yet)
- Loading / skeleton state
- Error / offline / no-connectivity state
- Permission-denied state (role-gated content, or device permission refused)
- Session-expired / re-authenticate prompt
- Pull-to-refresh

Section J — Later-Phase Candidates (Beyond MVP)

These are plausible future features based on what a comparable web platform offers. Not scoped for the initial build — included so the design system and navigation can leave room for them.

Screen	Priority	Purpose	Key elements to design
Medical Imaging	Phase 2	View/manage imaging studies and results.	To be scoped with the team.
Referrals	Phase 2	Track referrals between providers.	To be scoped with the team.
Audit Log Viewer	Phase 2	Compliance audit trail.	To be scoped with the team.
Admin Console	Phase 2	Organization and user management.	To be scoped with the team.
